VoIP Information

The U of M has begun deployment of VoIP sets in select locations across campus. Features of the new sets are the same as regular digital sets and they function in a similar manner. The sets do however differ from the traditional digital sets in several ways:

The sets are ethernet devices that connect to the data network rather than using a separate copper cable to connect back to the telephone switch.

The IP (Internet Protocol) set connects to the ethernet port in each office and the user's PC connects to the telephone.

IST is deploying several types of IP sets and info can be found on our website @ umanitoba.ca/ist/telecommunications/umt_userguides.html
