- Fusarium Head Blight disease risk assessments based on real-time weather from hundreds of prairie weather stations will be available on a publicly-accessible website using either a desktop computer, tablet or mobile phone
- Risk levels are calculated using weather-based algorithms determined from FHB research done on the prairies
- Producers can utilize the risk assessments to help decide if fungicide application will be beneficial and cost-effective
- Beta version is being tested; **public release is targeted for spring 2023**
