

Reseeding and Late Season Decision Making

With the recent decrease in commodity prices and stubbornly high input costs, tighter margins have resulted in a cost-price squeeze. While we have seen cost-price squeezes before, we haven't experienced them in a high-cost environment like we're seeing today. Couple this with extreme weather events and the profit probability for crop reseeding and late seeded crops become even more questionable. Join Darren as he explores the relationship between reseeding/late seeding and creating a reasonable opportunity for profit while mitigating risk.
