Welcome...

It is my privilege to present the Department of Clinical Health Psychology’s 2022 research report.

2022 was a year of foundational action for Clinical Health Psychology, laying the groundwork for exciting initiatives, while continuing to lead the ongoing academic and clinical services.

We were delighted to start working with the University to develop a legacy campaign, with the goal of establishing the first Endowed Professorship in the department. Once the funding goal is reached, this initiative will create a clinician-scientist position with 50% protected academic time to serve as a catalyst for research leadership, supporting our department’s mission of health care innovation through psychological science.

Planning is already in motion for our residency program’s 55th anniversary gala celebration in spring, 2025, to mark the tremendous contributions the department has made to professional psychology in Canada over the decades.

The department’s strategic planning was also initiated in 2022, providing a wonderful opportunity to engage Clinical Health Psychology faculty, staff, and trainees, as well as a wide range of stakeholders and partners both within Manitoba and across Canada, to imagine the future, and guide the next 3 to 5 years. We are so appreciative of the generosity of time and thoughtful reflection to help evaluate our strengths, re-establish our values and priorities, and identify directions for growth and development. The plan will be finalized and shared in the coming months, and will move us forward with a renewed sense of purpose and vision.

“The passion and commitment of the Department to make lives better is evident throughout the report.”

Finally, 2022 saw the monumental move in the health system of Clinical Health Psychology to Shared Health, formalizing our longstanding provincial mandate for clinical services and bringing new opportunities for outreach and integrative care.

In the midst of all that is underway, it is timely to pause and recognize the department’s accomplishments highlighted in our 2022 research report. The passion and commitment of the department to make lives better is evident throughout the report. I am both proud and grateful to be part of this amazing group of colleagues.
Greetings colleagues!

As we continue to navigate the aftermath of the pandemic in the varied roles of our profession—clinical service, research, and teaching—I am so proud to report on another immensely successful year of research in the Department of Clinical Health Psychology.

“Our faculty have been active developing and evaluating novel interventions for the treatment of a range of psychological challenges”

Serving as principal investigators and collaborators with colleagues both within and beyond our Department, our faculty have been active developing and evaluating novel interventions for the treatment of a range of psychological challenges, including perinatal anxiety, sleep difficulties, posttraumatic stress disorder, chronic pain, cognitive impairment, and preoperative distress, covering the lifespan and the diverse clinical settings in which we work. Collectively, we have also continued to generate important knowledge related to the link between mental and physical health, and on the risk and protective factors involved in the development of mental disorders.

This work has been supported by a number of different funding agencies and organizations, including the Clinical Health Psychology Early Career Researcher Award, the Manitoba Medical Services Foundation, and the Canadian Institutes of Health Research. Together in 2022, we achieved 55 peer-reviewed publications and book chapters, 11 grants where faculty served as PI or Co-I totaling approximately $4 million, 35 conference presentations, and 52 invited talks for various audiences.

Thank you, sincerely, for all of your contributions geared towards improving the lives of the patients we serve, and for another year of research excellence.

Natalie Mota PhD CPsych
Associate Professor, Research Director
Department of Clinical Health Psychology

  - 15 beginning career
- 12 Community Affiliate Faculty
- 15 Research Assistants

- 11 new grants
- More than $4 million in new funding
- 7 faculty awards and promotions
- 55 peer-reviewed articles and book chapters
- 35 conference presentations
- 52 invited presentations
In 2015, Manitoba’s forensic service began using a court clinic approach for fitness to stand trial assessments, in which a psychiatrist attends provincial court one day a week to conduct assessments and provide results to a judge within the same day, rather than requiring accused individuals to be transported from custody to a forensic psychiatric inpatient unit.

CHP researchers, Dr. David Hill and Sabrina Demetrioff, investigated the utility of this new approach in Manitoba.

“We found that the court clinic model of evaluation was associated with a significantly shorter time to complete forensic reports and a marked cost savings compared to a hospital-based model of assessment,” explains Dr. Hill. Reporting in the *International Journal of Forensic Mental Health*, Drs. Hill and Demetrioff found that a higher rate of accused individuals were deemed unfit to stand trial in the court clinic group than the hospital-based group, and forensic assessment reports cited mental disorder and relevant case law more often in the court clinic model.

“Our findings provide support for the use of community-based models for fitness to stand trial assessment, both in terms of efficient processing of court referrals and cost considerations for justice and forensic mental health systems,” says Dr. Hill, noting that more research is needed to optimize fitness to stand trial assessments at both provincial and national levels in Canada, including the involvement of forensic psychologists in these assessments.

HONOURS & ACHIEVEMENTS

PROFESSIONAL AWARDS

DISTINGUISHED LIFE MEMBERSHIP, MPS

Dr. Andrea Piotrowski, Assistant Professor, received a Distinguished Life Membership award from the Manitoba Psychological Society in April 2022. This honour is bestowed upon long-standing members of the Manitoba Psychological Society who have made exemplary contributions to the psychological community. Dr. Piotrowski completed three terms as President of MPS, raising the profile of professional psychology in the province through her advocacy work. Nationally, she served as Chair, Practice Directorate and on the Board with the Canadian Psychological Association, and Chair, Council of Professional Associations of Psychologists.

AWARD FOR CLINICAL EXCELLENCE, CPA

The Canadian Psychological Association presented the 2022 Award for Clinical Excellence to the Best Practices in Psychology Portal Development Team led by Dr. Maxine Holmqvist, Associate Professor, and Dr. Martin Drapeau, McGill University, in recognition of outstanding contributions to the practice and profession of clinical psychology in Canada. This award honours clinical psychologists who advance the understanding and amelioration of suffering and the promotion of psychological wellness.

PEDIATRIC PAIN FELLOW, HARVARD

Dr. Jennifer MacMullin, Assistant Professor, was selected from a competitive field of candidates for the opportunity to complete a fellowship with leading experts in pediatric pain at Boston Children’s Hospital, Harvard Medical School. This fellowship includes clinical and research training in pediatric pain rehabilitation and multidisciplinary chronic pain. We look forward to Dr. MacMullin’s return in Fall 2023 with the expanded knowledge and training to improve care for children and families in Manitoba.

PSYCHOLOGIST OF THE YEAR, FSPA

Dr. Pamela Holens, Associate Professor, was named the 2022 Psychologist of the Year by the Fire Service Psychology Association, a nonprofit organization that seeks to bridge the gap between professional psychology and the fire service. This honour is bestowed upon the fire service leader or psychologist who has demonstrated exemplary service to the profession through direct intervention services, creating mental health access for firefighters, contributing to fire service research, or improving cultural competence for clinicians.
HONOURS & ACHIEVEMENTS

RESEARCH AWARDS

FALCONER EMERGING RESEARCHER RH AWARD

Dr. Natalie Mota, Associate Professor, received the Terry G. Falconer Memorial Rh Institute Foundation Emerging Researcher Award in Health Sciences at the Rh Awards celebration event in April 2022. This prestigious University of Manitoba award recognizes early career faculty members (within 8 years of degree completion) who display exceptional promise, demonstrate high qualities in innovation, and stimulate research colleagues in their own and related disciplines.

TEACHING AWARDS

DR. ROBERT MCILWRAITH EXCELLENCE IN TRAINING AWARD

Dr. Lesley Ritchie, Assistant Professor, received the 2022 Dr. Robert McIlwraith Excellence in Clinical Training Award in recognition of commitment to resident teaching and supervision. CHP residents selected Dr. Ritchie as an outstanding mentor, teacher, and clinical supervisor, exemplifying ethical and professional behavior, and providing inspiration to learners. “Dr. Ritchie is exceptionally passionate about her professional work ... she instilled in trainees the importance of providing accessible clinical care and outreach to northern and indigenous communities ... She provides those with whom she works the confidence and capacity to grow in places they wouldn’t have dared go before on their own.”

DR. JOHN ARNETT EXCELLENCE IN TEACHING AWARD

Dr. Gillian Alcolado, Assistant Professor, was awarded the Dr. John Arnett Excellence in Teaching Award, which recognizes outstanding contributions to the teaching of learners in the Max Rady College of Medicine and Rady Faculty of Health Sciences who are external to the Department of Clinical Health Psychology. Dr. Alcolado was recognized for her extensive involvement in UGME teaching, and for her leadership in PGME, where she helped develop, implement, and evaluate the new professionalism curriculum. Dr. Alcolado consistently earns top ratings by students in her classroom teaching, and is exceptionally skilled at translating complex concepts for the learner level.

From Sand Castles to Psychiatric Comorbidity in Multiple Sclerosis & Immune-mediated Inflammatory Diseases
WRITTEN EXPOSURE THERAPY FOR PTSD

Dr. Carmen Bodkyn was awarded an Early Career Research Grant to adapt virtually-delivered Written Exposure Therapy (WET) for post-traumatic stress disorder (PTSD) to a group-based format, and to assess the feasibility and acceptability of this treatment modality.

“Individuals suffering with PTSD often experience a constellation of debilitating symptoms that have a significant impact on the quality of their daily lives,” says Dr. Bodkyn. “Written Exposure Therapy is a relatively new approach that emerged as a result of an effort to provide briefer, effective, well-tolerated trauma-focused treatment.”

Wait times to access trauma-focused treatments in Manitoba remain lengthy. By adapting WET to a group-based format delivered virtually, Dr. Bodkyn and colleagues hope to enable services to be offered more efficiently, increasing accessibility and decreasing wait times for evidence-based treatment for PTSD.

TRAUMA-INFORMED CARE EDUCATION FOR FAMILY MEDICINE

Dr. Seint Kokokyi was awarded an Early Career Research Grant to assess how best to engage and collaborate with patients and learners in the development of educational materials to train Family Medicine residents and physicians in trauma-informed care.

“Trauma survivors are often less likely to seek care, and more likely to experience re-traumatization in healthcare settings,” explains Dr. Kokokyi. “Trauma-informed care seeks to understand trauma, recognize its signs, symptoms, and long-term impact on individuals, and respond by setting policies that endeavor to actively prevent re-traumatization.”

By engaging patients in the development, delivery, and evaluation of educational materials, Dr. Kokokyi and colleagues aim to emphasize aspects of care that might have been previously missed or inadequately addressed. “Ultimately, we hope to use the results of this study to inform the engagement of patients and learners in curriculum development for a broad range of topics and audiences.”

COMMUNITY WATER FLUORIDATION AND INFLAMMATION

Dr. Julia Riddell was awarded an Early Career Research Grant to investigate the association between community water fluoridation and inflammation, including biomarkers of inflammation and the presence of inflammatory disorders.

“Fluoride is added to community water supplies to prevent tooth decay,” explains Dr. Riddell. “In a previous study, we found that a 1mg/L increase in tap water fluoride level was associated with a 6.1 times higher odds of having an ADHD diagnosis.”

Dr. Riddell seeks to build on this previous research by investigating whether formula-feeding using fluoridated water modifies the relationship between fluoride exposure and symptoms of inattention/hyperactivity in youth. She also plans to examine the relationship between fluoride exposure and inflammation, as inflammation of the brain has been suggested as a potential mechanism for the development of hyperactivity in animal studies.

“This research has the potential to impact recommendations regarding whether to use fluoridated water for the preparation of infant formula, which are currently inconsistent.”
Clinician-scientists in the Department of Clinical Health Psychology have long been harnessing research excellence to inform and improve clinical care. As both academics with the University of Manitoba and medical staff working in hospitals and health centres across the province, Clinical Health Psychology faculty in Manitoba are uniquely positioned to advance patient care and psychological health through research innovation.

Research in clinical health psychology spans a wide range of clinically relevant areas, from the epidemiology, presentation, assessment, and management of mental illnesses, to the psychological aspects of chronic disease, illness, and injury, to the interaction of physical and psychological features and its impact on patient outcomes.

Protecting academic time is critical to supporting the essential research being conducted in the field. To this end, the Department of Clinical Health Psychology is working to establish its first Endowed Professorship. This initiative will enable the creation of a clinician-scientist position with 50% protected academic time, with the goal of recruiting or promoting a leading Clinical Health Psychologist and expanding their capacity for leading-edge research in tandem with excellent patient care.

The Clinical Health Psychology Trust Fund was recently launched to fund the Professorship. The University of Manitoba is seeking to raise $1.3 million in donor support to accelerate the growth of this Trust Fund in order to establish the Professorship. This is an exciting opportunity to invest in the future of research excellence in Clinical Health Psychology.

As the Department continues to pursue innovation in psychological health and patient care, support from this Trust Fund will ensure the progression of our current work, enable the exploration of new research, and accelerate the development of collaborations in Manitoba and beyond.

Publishing recently in the journal *Emotion*, Dr. Ronak Patel and colleagues sought to examine how the emotional enhancement of memory might be differentially expressed by women and men (defined here by biological sex).

"The emotional enhancement of memory (EEM) effect refers to a phenomenon where we seem to remember emotionally salient or provocative events in our lives better than we can remember more mundane events," explains Dr. Patel. "While we have learned a lot about this phenomenon, such as what regions in the brain are involved in this enhancement effect, there is still much we don’t know."

The current study found that emotional stimuli – fearful, happy, and angry facial expressions – are better remembered by women than men, but only under certain circumstances. Specifically, women demonstrated a greater EEM effect when not required to explicitly focus on the emotional content of the faces with which they were presented.

"This study establishes that EEM can be differentially expressed in biological women versus men and that these sex differences may be driven by certain factors such as attention," says Dr. Patel. "Our findings also leave open the possibility that there are distinct differences in the brain between women and men that underlie the EEM effect."

---

**MILITARY SEXUAL TRAUMA IN THE CANADIAN ARMED FORCES**

Dr. Natalie Mota and colleagues, including CHP researcher Dr. Renée El-Gabalawy and doctoral student Ms. Jordana Sommer, recently investigated the burden of military sexual trauma (MST) in a sample of almost 3,000 regular force members and veterans of the Canadian Armed Forces.

“We found very high estimates of lifetime MST in this sample — 44.6% in females and 4.8% in males — with comparable estimates in still serving regular force members and veterans,” summarizes Dr. Mota. “The most prevalent type of MST for both sexes was unwanted sexual touching by a military member or employee.”

Published in the *Canadian Journal of Psychiatry*, the study identified younger age and exposure to a higher number of other, non-sexual traumatic events as factors associated with higher likelihood of reported MST in both sexes, whereas lower household income, a history of deployments, and serving in an air environment were correlates for women only.

The identification of these factors could help guide screening initiatives for subgroups of serving and veteran members who are at higher risk for MST and associated outcomes, explains Dr. Mota. “Continued efforts should be made in training military leadership in strategies to prevent MST, reducing stigma related to MST disclosure, and ensuring support for survivors.”

---

**MODULATION OF EMOTION-ENHANCED RECOLLECTION**

Publishing recently in the journal *Emotion*, Dr. Ronak Patel and colleagues sought to examine how the emotional enhancement of memory might be differentially expressed by women and men (defined here by biological sex).

“The emotional enhancement of memory (EEM) effect refers to a phenomenon where we seem to remember emotionally salient or provocative events in our lives better than we can remember more mundane events,” explains Dr. Patel. “While we have learned a lot about this phenomenon, such as what regions in the brain are involved in this enhancement effect, there is still much we don’t know.”

The current study found that emotional stimuli – fearful, happy, and angry facial expressions – are better remembered by women than men, but only under certain circumstances. Specifically, women demonstrated a greater EEM effect when not required to explicitly focus on the emotional content of the faces with which they were presented.

“This study establishes that EEM can be differentially expressed in biological women versus men and that these sex differences may be driven by certain factors such as attention,” says Dr. Patel. “Our findings also leave open the possibility that there are distinct differences in the brain between women and men that underlie the EEM effect.”
