Executive Summary

The aim of the Canadian Postsecondary Education Alcohol and Drug Use Survey (CPADS) is to obtain regular and current surveillance data that can help to describe trends in substance use among postsecondary students in Canada. Comprehensive and regular data collection is required to plan effective prevention and intervention strategies at the national and school level.

The following summary describes key results obtained from University of Manitoba’s participation in the first Pan-Canadian cycle of the CPADS conducted during the 2019/2020 school year.

Overall, 83% University of Manitoba students consumed alcohol and 44% cannabis over the past year. University of Manitoba students were as likely to consume illegal drugs as students in the overall Pan-Canadian survey sample.

University of Manitoba students had higher awareness of the Low Risk Drinking Guidelines (20% University of Manitoba, 16% Pan-Canadian) when compared to the Pan-Canadian sample of survey respondents. Approximately one-fifth (19%) of past 7-day drinkers exceeded the thresholds in the LRDG of 2 for women and 3 for men at the University of Manitoba. University of Manitoba students were less likely to experience any alcohol related harms related to their own alcohol consumption (47% University of Manitoba, 56% Pan-Canadian) including hangovers, throwing up and passing out. University of Manitoba students were also significantly less likely to experience harms due to the drinking behaviour of their peers (22% University of Manitoba, 31% Pan-Canadian).

In terms of beverage types preferred by students in the past 30 days, spirits and liquor (71%) and cooler and pre-mixed cocktails (<7% alcohol content) (62%) were the most popular beverages among students at the University of Manitoba. Beer, wine, coolers/pre-mixed cocktails (>6% alcohol content), and cider were less popular among University of Manitoba students compared to students in the overall survey sample.

University of Manitoba students who had used cannabis in the past 3 months show similar signs of dependence on cannabis as the overall survey sample, including the urge to use (53%) and failing others’ expectations (18%). Overall, 61% of University of Manitoba students were at moderate risk of developing cannabis-related problems based on the Alcohol, Smoking and Substance Involvement Screening Test (ASSIST), comparable to the Pan-Canadian survey sample.

Over one quarter (26%) of University of Manitoba students reported being unaware of harm reduction services available at the University of Manitoba. The three harm reduction services students reported being most aware of on campus included the student counseling centre for harm reduction services (59%), the university health service (49%) and the health and wellness educator (28%).

The majority of University of Manitoba students (57%) reported that they would prefer to have addictions counseling added as a harm reduction service provided by the school.
Background

In 2018, Health Canada identified the need for a surveillance tool to monitor substance use among the postsecondary student population in Canada. In November 2019, the Canadian Postsecondary education Alcohol and Drug use Survey (CPADS) was launched; a national online survey that measures the prevalence of alcohol and drug use among students 17 to 25 years of age, who are attending university or college in Canada.

Substance use is a significant cause of health and safety issues on Canadian campuses and higher rates of consumption make students more vulnerable to harms such as accidents (e.g., falls, driving accidents) as well as sexual and physical violence. In addition, student success at school can be affected if problematic substance use impedes a student’s ability to fulfill educational requirements. Students may use substances under pressure to improve academic performance. Comprehensive and regular data collection for this population is required to plan effective prevention and intervention strategies at the national and school level. These data will also be used support the development of policy and program initiatives, including public education and awareness activities.

The CPADS is conducted in collaboration with the Postsecondary Education Partnership-Alcohol Harms (PEP-AH), a network of universities and colleges from across Canada that have partnered with the Canadian Centre on Substance Use and Addiction (CCSA) to support campus efforts to reduce the harms related to alcohol consumption1.

---

Survey Administration

The survey firm *Advanis Jolicoeur* was hired to conduct data collection for the CPADS on behalf of Health Canada. The survey was delivered online to students and all responses were anonymous and confidential. The target population of the CPADS includes students 17-25 years of age who are enrolled either in a university undergraduate program or college program/certificate in Canada on a full-time or part-time basis.

Each school was responsible for selecting a random sample of students to invite to the CPADS. **University of Manitoba** provided a list of student e-mail addresses to Advanis who administered the survey invitations **directly to students**.

After clicking on the survey link, students were asked two eligibility questions to confirm their age and location of studies. Students who were between the ages of 17 to 25 years and were studying in Canada at the time they received the survey could proceed with responding to subsequent survey questions.

A total of 41 schools participated in the 2019/2020 CPADS; 33 schools participated in November 2019 and 8 schools participated in the winter of 2020 (Jan-March). The 2019/2020 CPADS was conducted from November 5, 2019 to December 13, 2019 at the University of Manitoba and the results are based on student responses from 1,671 completed surveys (39% male and 61% female). The average survey completion time was just over 18.5 minutes at the University of Manitoba and 20 minutes for the larger Pan-Canadian sample.

The following summary describes key results obtained from University of Manitoba’s participation in the first Pan-Canadian cycle of the CPADS, conducted during the 2019/2020 school year. School-specific results are compared to overall estimates obtained from the complete sample of 41 schools and only statistically significant differences are discussed in this report. A comprehensive set of data tables can be found in **Appendix 1**. The core CPADS questionnaire can be found in **Appendix 2**. **Appendix 3** contains results for school-specific questions that were asked only of students from University of Manitoba.
Technical notes and data limitations

- Results reported as a percentage are accompanied by their associated 95% confidence interval in the data tables. Note that exact values for 95% confidence intervals may vary depending on the statistical software used in the analysis and schools may obtain slightly different ranges.
- Estimates with moderate sampling variability are indicated throughout the text with the symbol ‘*’ and should be interpreted with caution.
- Some data are not reportable due to low numbers. Data are only reportable if the number of observations in a cell was $\geq 30$ and the coefficient of variation for the estimate was $<33.3\%$. Unreportable estimates are suppressed to ensure that participants cannot be identified. When numbers are not reported, this is indicated with the ‘#’ symbol in the data tables.
- Some numbers are rounded; therefore, totals may not add up to 100%.
- In each section of the report, students were compared on the following demographic and educational dimensions. All reported demographic differences are statistically significant at the 95% confidence level.
  - Male vs female students based on biological sex at birth
  - Students in 1st and 2nd year vs 3rd year or higher
- In some cases, school level numbers were compared to the Pan-Canadian average to highlight notable differences. All reported differences were significant at the 95% confidence level, but not all statistically significant differences are reported.
- Survey responses are reported by sex based on the question sex01, which asks about biological sex assigned at birth. This measure was chosen to align with recommendations in Canada’s Low-Risk Alcohol Drinking Guidelines (LRDG) Error! Bookmark not defined. The LRDG recommend safe drinking amounts based on sex, given the important biological differences in how alcohol is metabolised between males and females and the increased health risks to females who consume alcohol. Sex at birth may not reflect the respondent’s current gender identity, which is asked in question “demq01”.
- Survey weights were applied to ensure that estimates are representative of the student population at each school by sex and age.
- The overall survey sample does not include adequate representation from all Canadian regions to be considered “nationally representative”. Data are missing from British Columbia, Nunavut, Northwest Territories, and Yukon. The overall survey sample, is referred to as “Pan-Canadian”, rather than a ‘national’ sample.
- The number of schools recruited represent 21% of all colleges and universities in Canada (total=196). Some schools did not elect to participate, resulting in under representation in BC and in the northern territories. Some schools were not eligible to participate because they did not meet the eligibility criteria which included:
  - Having a registrar office
  - Having more than 500 students
  - Being a not-for-profit public or private school
  - Not offer exclusively online courses
  - Non-theological or military institutions
• Results are based on self-reported data which are subject to recall bias, data entry errors and prone to under- or over-reporting. Reporting errors may occur because respondents forget actual use with increasing consumption, heavier drinkers have higher rates of non-participation in surveys and desirability bias, where respondents may answer in a way that they think is socially acceptable. In addition, lack of knowledge of standard serving sizes may contribute to reporting errors.

• Lastly, the survey topic is indicated in the title of this project which could lead to a skewed sample of respondents that are more interested and knowledgeable on the topic of substance use. This may have led to over- or under-estimation of prevalence.
Results

Health Status

Participants were asked to rate their overall health and mental health using a 5-point Likert scale with the following categories: “excellent, very good, good, fair, and poor”. Overall, 86% of respondents rated their general health as “excellent, very good or good”. A lower proportion (61%) considered their mental health to be “excellent, very good or good”. Respondents with good mental health more likely to be male (69%).

Substance Use

The 2019/2020 CPADS measured substance use among postsecondary students for the following substances: alcohol, cannabis, psychoactive pharmaceuticals (i.e., pain relievers, sedatives, and stimulants) and illegal drugs (e.g., heroin, cocaine). Based on self-reported use in the past 12 months, the largest proportion of students used alcohol, followed by cannabis and psychoactive pharmaceuticals. The smallest proportion reported using illegal drugs in the past 12 months. Only substances with sufficient use to be reportable are included in this report.

Results for University of Manitoba are comparable to Pan-Canadian estimates, including past 12-month alcohol (83%), cannabis (44%), pharmaceutical (34%), and illegal drug use (14%). Estimates for these substances were 84%, 48%, 36%, and 15% respectively for the Pan-Canadian sample.

Figure 1. Past 12-month use of Alcohol, Cannabis, Psychoactive Pharmaceuticals, and illegal drugs* at University of Manitoba, CPADS 2019/2020

* Includes: Cocaine or crack, amphetamines, methamphetamines, ecstasy or similar designer drugs, Salvia, Hallucinogens, Sniffed glue, gasoline or other solvents, Heroin, Synthetic cannabinoids, Mephedrone, BZP/TFMPP

ALCOHOL

Participants of the 2019/2020 CPADS were asked how familiar they were with Canada’s Low-Risk Alcohol Drinking Guidelines (LRDG), their perception about what constitutes low risk drinking amounts and about
their alcohol use patterns. Among those who reported using alcohol, subsequent questions were asked to determine which alcoholic beverages they preferred, the quantities of alcohol consumed, alcohol-related harms, protective strategies used to reduce intoxication and about alcohol-impaired driving.

Throughout this report, the LRDG are defined as follows:

**Canada’s Low-Risk Alcohol Drinking Guidelines (LRDG)**

The LRDG provide information on how to reduce the risk of alcohol-related harms in both the short-term (acute; e.g., intoxication, injuries, assault) and long-term (chronic; e.g., cancer) among individuals who choose to drink. The LRDG apply to individuals 25 to 65 years of age; **youth in their late teens to age 24 years should never exceed the daily and weekly limits outlined in the chronic LRDG.** The CPADS calculates the proportion of respondents who exceed the chronic LRDG based on alcohol consumption in the 7 days prior to the survey. Throughout this report, the term LRDG will refer to daily and weekly limits outlined in the following definition:

**Low-risk drinking guideline (chronic):** people who drink within this guideline must consume "no more than 10 drinks a week for women, with no more than 2 drinks a day most days and 15 drinks a week for men, with no more than 3 drinks a day most days. Plan non-drinking days every week, to avoid developing a habit.”

**Awareness of the Low-Risk Drinking Guidelines**

Approximately one-fifth of respondents (20%) had heard of the LRDG (higher than 16% Pan-Canadian sample). When asked to indicate their perceptions of what they thought daily low-risk drinking amounts were for men and women, 23% reported estimates that aligned with the daily limits established in the LRDG (lower than 28% Pan-Canadian sample).

**Figure 2. Awareness of Canada’s Low-Risk Alcohol Drinking Guidelines (LRDG) and perceptions of low-risk daily drinking amounts, CPADS 2019/2020 University of Manitoba**

![Figure 2](image)

1 Canada’s Low-Risk Drinking Guidelines (LRDG) state that women must drink no more than 10 drinks a week, with no more than 2 drinks a day most days. Men must drink no more than 15 drinks a week, with no more than 3 drinks a day most days. Plan non-drinking days every week to avoid developing a habit.

**Alcohol use**

Survey participants were asked if they had consumed an alcoholic beverage in the past year, month and with which frequency. They were also asked to indicate how frequently they had consumed different types of alcoholic beverages as well as their typical and heaviest drinking amounts on drinking days.
The vast majority of survey participants had consumed alcohol in the past 12 months (83% University of Manitoba) and in the past 30 days (71% University of Manitoba, lower than 77% Pan-Canadian sample). The mean age of alcohol initiation was 16 years with no difference between sexes. Among Pan-Canadian respondents who consumed alcohol in the past 12 months, 10% were underage based on the legal drinking age of the province in which their school was located. The proportion of students who were underage was too small to be reported for the University of Manitoba.

Among University of Manitoba students, the largest proportion reported that they consumed alcohol at least once per week. Respondents who consumed alcohol at least once per week were more likely to be:

- Males (36%)
- Third year or greater (34%).

Figure 3. Frequency of past 30-day alcohol use, CPADS 2019/2020 University of Manitoba

Beverage preferences

Past 30-day drinkers were asked which alcoholic beverages they preferred and how frequently these were consumed. Information collected on beverage type can help determine the level of risk as students may be more likely to become intoxicated depending on the type and concentration of alcohol consumed.

The most commonly reported beverage in the past 30 days was spirits and liquor (71%) followed by cooler and pre-mixed cocktails (<7% alcohol content) (61%). Male respondents were more likely to consume:

- Beer (79%)
- Spirits and liquor (75%)

Female respondents were more likely to consume:

- Wine (65%)
- Cooler and pre-mixed cocktails (<7% alcohol content) (73%)
- Cooler and pre-mixed cocktails (>6% alcohol content) (56%)

Energy drinks and “alcopop” consumption: Consuming energy drinks mixed with alcohol has the potential to increase alcohol consumption and related harms. Caffeine is a stimulant which can mask the effects of alcohol intoxication and lead to overconsumption. CPADS participants were asked if they had consumed energy drinks in the past 30 days and if they had consumed various combinations of energy drinks mixed with alcohol (e.g., hand-mixed, pre-mixed).
About one third (28%) of respondents from the University of Manitoba had consumed an energy drink on its own in the past 30 days (higher than 24% of the Pan-Canadian sample). The consumption of energy drinks on the same occasion as alcohol or mixed with alcohol (hand mixed or pre-mixed) was reported by 18% of University of Manitoba students within the past 30 days.

Respondents were asked if they had consumed sweetened high alcohol content beverages (i.e. ‘alcopops’) with alcohol content of 7% or higher such as ‘Four Loko’, ‘FCKD UP’ or ‘Clubtails’ in the past 30 days. In total, 4% of University of Manitoba students reported they had consumed such a beverage in the past 30 days, lower than the 6% of students in the Pan-Canadian sample.

**Figure 4. Past 30-day alcohol use by beverage type, CPADS 2019/2020 University of Manitoba**

*The prevalence of consuming an energy drink and alcohol separately, hand mixed or pre-mixed on one occasion. Measured among those who reported consuming an energy drink mixed with alcohol in the past 30 days.

**At-Risk/Harmful drinking**

Information collected on the frequency of alcohol consumption can be used concurrently with information on quantity to describe the intensity of alcohol consumption among postsecondary students, and the degree of risk for alcohol related harms.

The main measures used to describe harmful drinking patterns among respondents of the CPADS include heavy drinking and adherence to the LRDG.

**Heavy drinking:** is defined as having four (4) or more drinks for women and five (5) or more drinks for men on one occasion in the past 30 days. ‘On one occasion’ means consuming drinks at the same time (i.e., consecutively) or within a couple of hours of each other.

Based on this definition, 56% of respondents from the University of Manitoba had engaged in heavy drinking in the past month, which is consistent among males, females, and year of study. Heavy drinking
occurred most often once a month (24%). Fewer respondents drank heavily 2 to 3 times per month (19%) and at least once a week (12%). The proportion of students who did not drink heavily in the past month was 44% (higher than 40% Pan-Canadian).

Respondents reporting heavy drinking at least once per week were more likely to be males (15%).

**Figure 5. Frequency of Heavy Drinking in the past 30 days, CPADS 2019/2020 University of Manitoba**

Adherence to the LRDG is calculated based on alcohol consumption among respondents who consumed alcohol within the seven (7) days prior to the survey. This calculation has limitations since student drinking patterns are influenced by events throughout the school year (e.g. exams, frosh week) and examining drinking within the past week may not be a representative snapshot of typical behaviour.

Among past week drinkers, the proportion of students from the University of Manitoba who exceeded the weekly LRDG limits (no more than 10 for females and 15 for males) was 19%. The proportion who exceeded the daily LRDG limits, but not the weekly limits was 57% (lower than 64% Pan-Canadian). The proportion who exceeded both the daily and weekly limits in the LRDG was 19%.

**Drinking quantities**

The CPADS asked participants to report the number of drinks typically consumed on drinking days and the number of drinks consumed on their heaviest drinking day in the past month. Measuring harmful alcohol consumption based on the definition of heavy drinking or based on the LRDG has limitations since factors such as body weight, alcohol tolerance, and food intake/hydration prior to drinking can influence alcohol absorption rates and the level of intoxication. Using a single threshold does not always differentiate those most at risk for consequences resulting from intoxication. As such, it is important to measure the actual number of drinks consumed by survey participants and ranges of consumption to assess the potential for harm.

Among CPADS respondents who had consumed alcohol in the past year, the ‘typical’ number of drinks they consumed on drinking days in the past month was four (4.1 University of Manitoba, lower than 4.5 Pan-Canadian sample). In contrast, when students from the University of Manitoba were asked to report the highest number of drinks they remember consuming on a drinking day in the past month, they reported 6.7 drinks on average. Both typical and peak amounts consumed exceed the limits in the LRDG.

The typical and heaviest drinking amounts were higher for males than females (typical number of drinks: 4.5 males, 3.8 females; heaviest drinking day: 7.8 males, 5.7 females). However, it should be noted that the average time reported to consume heaviest drinking amounts was similar between sexes (218 min males; 215 min females).
Blood Alcohol Concentrations

The calculation of blood alcohol concentrations (BAC) for the heaviest drinking day in the past month incorporates adjustments for individual factors that can affect alcohol metabolism and impairment. BAC is used as a proxy measure of the degree of intoxication in an individual. The estimated BAC among CPADS respondents is calculated using a formula developed by Seidl et. al, that takes into account the amount of alcohol consumed, the time period over which it was consumed and the individual’s height and weight, which can all impact how alcohol is metabolised. Students who reported zero drinks on their heaviest drinking day were excluded from analysis, as were students with a BAC level of 500mg/dL (0.50g/dL) or higher since this level is presumed to result in death.

Results are presented as the proportion of respondents who exceeded the legal blood alcohol limit of 80mg/dL (0.08g/dL) or 0.08%. Only respondents who have consumed at least one beverage on the heaviest reported drinking day in the past month are included in the analysis.

It is important to note, that BAC levels are a proxy for impairment and should not be used to determine the legal blood alcohol level of participants. BAC calculations based on self-reported alcohol consumption is subject to limitations and has been shown to overestimate levels when compared to BAC measured using breath samples. Also BAC calculations do not account for food intake, respondent’s perception/ recall of alcohol use and the use of other substances which may affect how alcohol is metabolized.

Based on the heaviest drinking day reported by students at the University of Manitoba who consumed alcohol in the past month, the proportion who exceeded the legal threshold for alcohol-impaired driving of 0.08% was 78%.

Drunkenness

Given individual variation that can affect the relationship between the amount of alcohol consumed and intoxication, the CPADS specifically asked respondents about drunkenness. Drunkenness is a self-assessed indicator of level of impairment and potential for harm. Approximately 69% of University of Manitoba respondents who had consumed alcohol in the past month reported feeling drunk (less than 74% for the Pan-Canadian sample).

The proportion of respondents who reported feeling drunk once a week or more often was 15%, which is less than 23% reported among the Pan-Canadian sample.

Alcohol Harms to Self

Participants in the CPADS were asked if they had experienced a range of different harms as a result of their own drinking. Alcohol-related harms were assessed using an adapted version of the Brief Young Adult Alcohol Consequences Questionnaire (B-YAACQ), which is a measure of alcohol problem severity.

Among those who drank alcohol within the past 12 months, 47% had experienced at least one alcohol related harm in the past 30 days, which is less than the Pan-Canadian estimate (56% Pan-Canadian sample). The top five harms reported were that they experienced a hangover (27%), said or did something embarrassing (19%), had less energy or felt tired (17%), drank on nights when planned not to (16%), and felt sick to their stomach or threw up (13%).
Among alcohol related harms, those in first and second year were more likely to report they:

- Said or did embarrassing things (21%)
- Needed larger amounts to feel effect (10%)

**Figure 6. Top five Alcohol related harms experienced due to own drinking in past 30 days, by sex, [among past 12-month drinkers], CPADS 2019/2020 University of Manitoba**

* This proportion is based on 24 harms in the B-YAACQ scale

**Alcohol Harms to Others**

Respondents were asked if they had experienced any secondary harm caused by another student’s drinking. Approximately 22% of respondents experienced at least one harm within the past 30 days as a result of another student’s drinking (less than 31% Pan-Canadian sample). Respondents who were more likely to experience an alcohol related harm due to others drinking were female (24%).

In the past 30 days, the most commonly reported secondary harms by students were the need to take care of another student (11%), they were upset or disappointed by another student (9%), and their sleep was affected (7%).

**Alcohol Protective Strategies**

The overwhelming majority of respondents (98% University of Manitoba, 98% Pan-Canadian) who consumed alcohol in the past 30 days employed protective strategies to slow down alcohol consumption, avoid intoxication and prevent dangerous alcohol-related consequences. However, some strategies were used more frequently than others. The strategies most often reported as ‘always’ or ‘usually’ used by respondents included: only drinking alcohol in safe environments (81%), using a designated driver (80%),
eating before and/or during drinking (80%), avoiding getting in a car with someone who had been drinking (70%), and never leaving a drink unattended (70%).

Female respondents were more likely to employ the following strategies:

- Used a designated driver (83%).
- Never left a drink unattended (79%).
- Avoided getting in a car with someone who had been drinking (73%).
- Limited money spent on alcohol (65%).
- Refused a drink from a stranger (62%).
- Alternated non-alcoholic beverages and alcohol beverages (33%).
- Paced their drinks to 1 or fewer per hour (28%).
- Had a friend let them know when they have had enough (26%).

Students in their first or second year were more likely to employ the following strategies:

- Avoided getting in a car with someone who had been drinking (73%).
- Refused a drink from a stranger (59%).
- Had a friend let them know when they have had enough (25%).
- Avoided drinking games (21%).
- Avoided situations where there was alcohol (11%).

Students in their third year or higher were more likely to make their own drinks (61%).
Figure 8. Alcohol protective strategies used ‘always’ or ‘usually’ when drinking in the past 30 days, CPADS 2019/2020 University of Manitoba

Alcohol Impaired Driving

Respondents were asked to indicate if they had ever been a passenger in a car driven by someone who consumed two (2) or more alcoholic drinks in the past two (2) hours or if they had ever driven after doing so themselves. Young adults, 20-24 years of age, are more likely than drivers in other age groups to be accused of impaired driving. In 2015, the rate of impaired driving among this age group was 480 incidents per 100,000 drivers, compared to 201 per 100,000 among the general population. The rate of impaired driving among young adults has been declining over time.ii

The proportion of students from the University of Manitoba who reported driving within 2 hours of consuming at least 2 drinks was 14% (higher than 9% Pan-Canadian sample). Similarly, a higher proportion of students at University of Manitoba reported being a passenger with a driver who had consumed 2 or more drinks within the past 2 hours as students at other universities in the survey (20% University of Manitoba, 16% Pan-Canadian).
**Drinking Environment**

Participants were asked a number of questions regarding the environment in which they consumed alcohol, such as their preferred location for drinking, if they took advantage of alcohol promotions offered on campus during the past 12 months and how much they paid for alcoholic beverages.

*Drinking location:* Among participants from the University of Manitoba who reported consuming alcohol in the past 30 days, 93% reported consuming alcohol off campus (higher than 86% Pan-Canadian).

*Alcohol promotional events:* In the 12 months before the survey, 64% of respondents took advantage of at least one alcohol promotional event (higher than 59% Pan-Canadian).

Respondents were most likely to participate in happy hour (52%, higher than 41% Pan-Canadian), followed by low-priced promotions such as ladies’ night (33%) and special promotions hosted by alcohol companies (25%).

Participants reported that the lowest amount they spent on one alcoholic beverage over the past month was, on average, $4.92 ($5.00 Pan-Canadian average). This amount will be tracked over subsequent survey cycles to determine if the minimum amount that students are spending on alcohol is changing. The recommended price for a standard serving of alcohol is $1.71 and was established by the National Alcohol Strategy Advisory Committee Working Group in 2015 as part of the development of the CCSA’s National Strategy for Alcohol.

**CANNABIS**

The 2019/2020 CPADS included questions to determine students’ general knowledge and sources of information related to cannabis. Questions also determined the prevalence and patterns of cannabis use among respondents in the past 12 months and in the past 30 days. Questions about cannabis did not differentiate between medical and non-medical use as it was anticipated that the proportion of young adults who use cannabis exclusively for medical purposes would be small and would not greatly impact estimates.

Those who reported using cannabis were subsequently asked detailed questions about their frequency of cannabis use, age of initiation, types of cannabis products used, typical THC to CBD ratio preferences in cannabis products, usual source of cannabis, impaired driving and cannabis-related harms.

**Exposure to education campaigns, public health or safety messages**

Respondents were asked if they had seen or heard education campaigns, public health or safety messages about cannabis in various locations since the cannabis law came into effect on October 17, 2018. Respondents could select more than one location if they had seen or heard these messages in multiple locations. The five most common locations to have seen or heard these messages were:

- School (77%)
- Social media (74%)
- Public display of posters or billboards (64%)
- TV/radio (51%)
- Health care setting (46%)
In total, 5% of students from the University of Manitoba reported that they had not noticed any education campaigns or public health messages (lower than 7% Pan-Canadian).

Compared to Pan-Canadian estimates, students from University of Manitoba reported higher exposure to cannabis related education campaigns and safety messages at school (77%, 71% Pan-Canadian), on posters or billboards (64%, 51% Pan-Canadian), in health care settings (46%, 41% Pan-Canadian), and inside/outside legal cannabis stores (33%, 28% Pan-Canadian). University of Manitoba students reported lower exposure to cannabis related education campaigns than the Pan-Canadian sample on non-social media websites (26%, 29% Pan-Canadian) and inside/outside illegal cannabis stores (5%, 7% Pan-Canadian).

Increase in knowledge of harms related to cannabis

Respondents were asked if their knowledge of the harms related to cannabis increased since the coming into force of the Cannabis Act. Almost one-third (29%) of students who responded from the University of Manitoba reported that their knowledge of harms related to cannabis increased.

Knowledge about harms related to cannabis

Respondents were asked if they knew cannabis smoke to be harmful, whether cannabis use during pregnancy or breastfeeding can be harmful, if frequent cannabis use can increase the risk of mental health problems, and whether teenagers are at greater risk of harm from cannabis use than adults. For all these harms the majority of students reported they believe these risks to be true:

- 79% (less than 83% Pan-Canadian) reported cannabis smoke can be harmful,
- 90% believed cannabis use can be harmful during pregnancy,
- 80% (less than 85% Pan-Canadian) believed frequent cannabis use can increase the risk of mental health problems, and
- 84% (less than 88% Pan-Canadian) agreed that teenagers are at greater risk of harm from cannabis use than adults.

Females were more likely than males to know that cannabis can be harmful during pregnancy or breastfeeding (93%).

Compared to Pan-Canadian estimates, students from University of Manitoba reported having lower levels of agreement that cannabis smoke can be harmful, increases the risk of mental health problems, and creates greater risk of harm for teens than adults.

Cannabis Use

Within the past 12 months, 44% of all respondents from University of Manitoba had used cannabis. Past 12-month cannabis users were more likely to be in their third year or greater (48%).

The average age of initiating cannabis use was 17.5 years.

Approximately 28% of respondents had used cannabis in the past 30 days (lower than 33% Pan-Canadian), which was higher among males (30%) and students in their third year or higher (30%).
The majority of University of Manitoba respondents had not used cannabis in the past 30 days (72%), while the greatest proportion used one to three days per month (15%), followed by one to four days per week (7%). Compared to Pan-Canadian estimates, students from the University of Manitoba were less likely to use cannabis in the past 12 months and past 30 days.

**Figure 9. Frequency of past 30-day cannabis use, CPADS 2019/2020 University of Manitoba**

Changes in use over time

CPADS respondents were asked to indicate if they had changed the amount of cannabis they use since the cannabis law came into effect October 17, 2018. Most students from the University of Manitoba reported using a similar amount (43% University of Manitoba, lower than 49% Pan-Canadian) rather than a larger amount (29%) since legalisation. Seventeen percent of students from University of Manitoba, reported using a smaller quantity of cannabis since cannabis legalisation and regulation.

Types of cannabis products used and frequency

Students who used cannabis in the past 12 months were asked about the types of cannabis products they had used in the past year and the frequency with which these were consumed. The six most common products used by respondents from the University of Manitoba were:

- Dried flower/leaf (69%)
- Cannabis edible products (58%)
- Cannabis vape pens/cartridges (49%, higher than 40% Pan-Canadian sample)
- Cannabis oil for oral use (32%, higher than 24% Pan-Canadian sample)
- Cannabis concentrate/extracts (20%)
- Hashish/kief (14%)  

Compared to Pan-Canadian estimates, students from University of Manitoba reported using similar types of cannabis products, with the exception of cannabis vape pens/cartridges and cannabis oil for oral use, which are both higher than the Pan-Canadian sample.
Relative levels of Tetrahydrocannabinol (THC) and Cannabidiol (CBD) in cannabis products

Respondents who used cannabis in the past 12 months were asked about the relative levels of THC and CBD in the cannabis products they typically use. CBD attenuates the effect of THC on the body and cannabis products with higher ratios of THC compared to CBD have stronger psychoactive properties. Twenty-seven percent (27%) of students from the University of Manitoba indicated using cannabis products with higher levels of THC and twelve percent (12%) indicated higher CBD and lower THC. Most of the “other” responses indicated the use of products with different levels of THC and CBD depending on the purpose of use or the time of day. In total, 40% of students indicated they did not know the relative levels of THC and CBD.

Sources used to obtain the cannabis product

Respondents who indicated using cannabis in the past 12 months were asked who they usually obtained cannabis from in the past year, including if cannabis was purchased from a legal or illegal source. The top source to obtain cannabis was from a legal storefront (42%), which is higher than the 34% among Pan-Canadian sample.
Frequency of cannabis use to get "high" before school or work

Students who had used cannabis in the past 12 months were asked about the frequency of cannabis use to get "high" before or at school. Overall, 73% reported they had not used cannabis to get "high" before or at school in the past 12 months which is more than among Pan-Canadian sample (64%). In total, 19% of students from the University of Manitoba who had used cannabis in the past 12-month cannabis reported rarely using cannabis before or at school (less than once a month).

Cannabis Impaired Driving

People who had used cannabis in the past 12 months were asked about their driving habits relative to their cannabis use. All respondents were also asked if they had ever been a passenger in a vehicle driven by someone who used cannabis within two hours.

Among students from the University of Manitoba who had used cannabis in the past 12 months, 22% reported that they had ever driven within two hours of smoking or vaporizing cannabis, which is higher than the overall survey sample (17% Pan-Canadian).

The proportion of students from the University of Manitoba who reported being a passenger with a driver who had smoked or vaporised cannabis within 2 hours was 31%. Such respondents were more likely to be in their third year of studies or greater (35%).

ASSIST

The Alcohol, Smoking and Substance Involvement Screening Test (ASSIST) was developed for the World Health Organization (WHO) by an international group of researchers specialised in problematic substance use to detect and manage substance use and related problems in primary and general medical care settings. The ASSIST module is used to screen respondents of the CPADS for problematic cannabis use.

Respondents are categorised based on their consumption as follows:

1. Low risk of developing health and other problems (score of 0-3)
2. Moderate risk of developing health and other problems (score of 4-26)
3. High risk of developing health and other problems and likely to be dependent (score of 27+)

Among those who reported using cannabis in the past three months, 58% experienced at least one of the five cannabis-related harms asked in the ASSIST module. The most commonly reported harm related to their use was a desire or urge to use cannabis (53%), followed by failing others’ expectations (18%).

A cannabis substance involvement score was calculated for past three-month users based on their responses to the ASSIST module. Approximately 34% of respondents were at low risk of developing cannabis related health problems (score 0-3). The proportion of respondents from the University of Manitoba with a score of 4-26, indicative of moderate risk of developing cannabis related health problems was 61%. The proportion of respondents with a score of 27 or more, indicating the likelihood of cannabis dependence, was unreportable.
Polysubstance use

Those who reported using cannabis within the past 12 months, were asked if they had used another substance at the same time as cannabis. The largest proportion of respondents from the University of Manitoba (74%, lower than 79% Pan-Canadian) used cannabis with alcohol, followed by cannabis use at the same time as tobacco and e-cigarettes with nicotine (38%).

PSYCHOACTIVE PHARMACEUTICALS

Participants were asked about their use of four classes of pharmaceuticals, namely opioid pain relievers, stimulants (such as medication prescribed for Attention Deficit Hyperactivity Disorder), sedatives and over-the-counter medications. While these drugs are intended for therapeutic purposes, they have the potential to be abused due to their psychoactive properties.

The first three classes of pharmaceuticals were asked of all participants to determine the prevalence of use in the past 12 months. Among 12-month users, problematic use was also assessed.

*Problematic use* was defined as using a larger dose than recommended, using more frequently than recommended or using with the intention to get high.

The prevalence of over-the-counter medication use was not asked since use of these substances is common. However, the CPADS included one question to ask respondents if they had used the following over-the-counter medications for reasons other than health or medical purposes: anti-motion sickness or nausea medicine (e.g., Gravol®); sleeping medicine (e.g., Nytol®); and cold or cough medicine (e.g., Robitussin DM®, Benylin® DM, also known as robos®, dex® and "DXM").

Psychoactive pharmaceutical use

Overall, 34% of respondents from the University of Manitoba had used at least one of opioid pain relievers, stimulants, or sedatives in the past 12 months.

Overall, 28% of respondents from the University of Manitoba had used a prescription opioid pain reliever in the past 12 months, 6% used stimulants and 7% used sedatives.

Compared to Pan-Canadian estimates, students from the University of Manitoba were more likely to report using pain relievers (24% Pan-Canadian), and less likely to report using stimulants and sedatives (12% and 9%, respectively, for Pan-Canadian respondents).
Problematic use of psychoactive pharmaceuticals

Problematic use of psychoactive pharmaceuticals was calculated among those who have consumed a psychoactive pharmaceutical in the past 12 months.

Problematic use was reported by 34% of past year users of pain relievers, stimulants, sedatives, or over-the-counter medication from the University of Manitoba.

Naloxone kits

Approximately 30% of respondents had heard of naloxone kits in their lifetime, which is less than the Pan-Canadian estimate (40%). Respondents more likely to have heard of naloxone kits were in their third year or greater (34%).

OTHER DRUGS

Illegal Drug use

CPADS participants were asked if they had ever used any of the following 11 illegal drugs: cocaine and crack; amphetamines; methamphetamine; ecstasy or others similar designer/club drugs; hallucinogens; heroin; sniffed glue, gasoline or other solvents; salvia; synthetic cannabinoids; mephedrone; and BZP/TFMPP. Approximately 14% of participants from the University of Manitoba reported using at least one of these substances during the past 12 months.

Users were more likely to be:

- Males (16%)
- Third year or greater (16%)

DRUG HARMS

CPADS respondents who reported using cannabis, any illegal drug or who had engaged in problematic use of psychoactive pharmaceuticals or over-the-counter medication in the past 12 months were asked if they had experienced any harm as a result of their use. Respondents were asked if there was ever a time they felt their general drug use had a harmful effect on one of eight factors: physical health; friendships and social life; financial position; home life or marriage; work, studies, or employment opportunities; legal problems; difficulty learning; or housing problems.

Approximately 5% of respondents from the University of Manitoba experienced at least one harm due to their substance use.

SMOKING TOBACCO AND VAPING

Information was collected on current smoking status, the frequency of using an e-cigarette or vaporisers and the product which was vaped. Respondents’ were also asked their motivations for using these devices. Tobacco smoking is often concurrent with use of alcohol and other drugs and when combined, can intensify health consequences.
The proportion of students from University of Manitoba who occasionally smoke tobacco is 7%. Although the proportion of daily smokers is 2% among the Pan-Canadian sample, the result for the University of Manitoba is unreportable.

In total, 14% of University of Manitoba students reported using an e-cigarette or had tried vaping in the past 30 days which is lower than 17% of all Pan-Canadian respondents.

**SCHOOL-SPECIFIC QUESTIONS**

Over one-quarter (26%) of students from the University of Manitoba reported being unaware of any harm reduction services at the University of Manitoba. The three services students reported being most aware of included the student counseling centre for harm reduction services at the school (59%), the university health service (49%) and the health and wellness educator (28%).

University of Manitoba students were most likely to want to see addictions counseling as a service provided by the school to support harm reduction for substance abuse (57%).

Female students were more likely than male respondents to want to see support for:

- Addictions counseling (61%),
- Substance use treatment groups (44%),
- A safer use space (40%), and
- Harm reduction room (36%).

First and second year students were more likely to want to see support for addictions counseling (60%), compared to students in third year or higher (54%).

¹ Heavy drinking is defined as consumption of 4 or more drinks for women and 5 or more drinks for men on one occasion in the past 30 days
² A measure of the proportion of respondents who exceed Canada’s Low-Risk Alcohol Drinking Guidelines. Calculations are based on respondents alcohol intake in the 7 days prior to the survey.
LRDG: People who drink within this guideline must drink no more than 10 drinks a week for women, with no more than 2 drinks a day most days and 15 drinks a week for men, with no more than 3 drinks a day most days. Plan non-drinking days every week to avoid developing a habit.

\(^1\) School effects include:

*ahs_k: I have missed work or classes at school because of drinking, a hangover or illness cause by my drinking’

*ahs_r: “The quality of my work or schoolwork has suffered because of my drinking’

*ahs_t: " I have neglected my obligations to family, work of school because of drinking’

\(^2\) Dependence effects include:
*ahs_g: I have found that I needed larger amounts of alcohol to feel any effect, or that I could no longer get drunk on the amount that used to get me drunk.
*ahs_m: I have found it difficult to limit how much I drink
*ahs_x: I have felt like I needed a drink after I’d gotten up (that is, before breakfast)

\(^{3}\) Acute physical effects include:
*ahs_k: I have had a hangover (headache, sick stomach) the morning after I had been drinking *
*ahs_c: I have felt very sick to my stomach or thrown up after drinking *
*ahs_f: I have passed out from drinking *
*ahs_i: I’ve not been able to remember large stretches of time while drinking heavily *
*ahs_q: I have had less energy or felt tired because of my drinking’
*ahs_v: I have put on weight because of drinking *
*ahs_w: Harm to physical appearance

¹ WHO - Alcohol, smoking and substance involvement screening test.
What the score means:
Low: You are at low risk of health and other problems from your current pattern of use.
Moderate: You are at risk of health and other problems from your current pattern of substance use.
High: You are at high risk of experiencing severe problems (health, social, financial, legal, relationship) as a result of your current pattern of use and are likely to be dependent.

Thank you for agreeing to participate in the Canadian Postsecondary Education Alcohol and Drug use Survey, distributed by the survey firm Advanis on behalf of Health Canada. Si vous préférez répondre au questionnaire en français, veuillez utiliser le bouton ci-dessous.

If you would like to speak to someone after you complete the survey or for more information on resources related to substance use available at your school, please click the following symbol which can be found at various points throughout the survey.

If you are unable to complete the survey in one session, your partial response will be saved for this survey.

© 2019 Advanis Privacy Policy (http://www.advanis.ca/privacy_policy2.html)
Some questions may be uncomfortable to answer as they ask about illegal activities or sensitive topics such as physical or sexual harms related to alcohol use. If you would like to speak to someone after you complete the survey or for more information on resources related to substance use available at your school, please click the following symbol which can be found at various points throughout the survey.

This research has been approved by the Health Canada and Public Health Agency of Canada Research Ethics Board. Any reports or publications produced by Health Canada based on this research will use grouped data and will not identify you or link you to these survey results.

The personal information you provide is governed in accordance with the Privacy Act and collected under the authority of the Controlled Drugs and Substances Act. Personal information is collected in accordance with Health Canada’s Controlled Drugs and Substances Strategy, to help promote student health and safety across the country. Your survey responses will be given a unique ID number, all direct identifiers will be removed, and other steps will also be taken so that the risk of identification is extremely low. Your de-identified information will be provided to Health Canada and possibly your school and external researchers.

If you are unable to complete the survey, your partial response will be saved for this survey.

Should you have any ethical questions or concerns regarding your participation in this research study, you may contact your school's ethics board.

Thank you for your interest in our survey.

Based on your responses to one or more of the previous questions, you are unfortunately not eligible to participate.

(http://www.advanis.net)

Status Code: 501

SEX01

What was your sex at birth?

- 1 Male
- 2 Female
- 8 I prefer not to answer

DEMQ01

What is your gender?

(Refers to the gender you currently identify with, which may be different from sex assigned at birth and may be different from what is indicated on legal documents.)

- 1 Male
- 2 Female
- 3 [You don’t have an option that applies to me. I identify as (please specify): / Other gender, please specify: ] ________________________________
- 8 I prefer not to answer
- 9 I don’t know

HWBQ01

Please rate your physical health, according to the following scale:

- 1 Excellent
- 2 Very good
- 3 Good
- 4 Fair
- 5 Poor
- 8 I prefer not to answer
- 9 I don’t know
HWBQ02

Please rate your mental health, according to the following scale:

- 1  Excellent
- 2  Very good
- 3  Good
- 4  Fair
- 5  Poor
- -8 I prefer not to answer
- -9 I don’t know

ALC01

Have you heard of Canada’s Low Risk Drinking Guidelines?

- 1  Yes
- 2  No
- -8 I prefer not to answer
- -9 I don’t know

ALC2

The following questions are about your alcohol consumption. For the purpose of this survey, a drink means:

- 341 ml or 12 oz. of beer or cooler (bottle, can or draft)
- 142 ml or 5 oz. of wine
- 43 ml or 1.5 oz. of liquor or spirit (straight or mixed)

Include: light beer.

Exclude: de-alcoholised beer or coolers (0.5% alcohol) or cocktails such as Virgin Mary or Shirley Temple.
How many standard drinks in a typical day, do you think is considered a low risk amount *??*?

Please respond for both males and females

*??* For the purpose of this survey, a drink means:

- 341 ml or 12 oz. of beer or cooler (bottle, can or draft)
- 142 ml or 5 oz. of wine
- 43 ml or 1.5 oz. of liquor or spirit (straight or mixed)

Minimum: 0, Maximum: 60

For a woman: __________ drinks
For a man: __________ drinks

☐ -8 I prefer not to answer
☐ -9 I don’t know
ALC03
Have you ever had a drink *?*?
Drinking does not include having a few sips of wine for religious purposes.

*?* For the purpose of this survey, a drink means:

- 341 ml or 12 oz. of beer or cooler (bottle, can or draft)
- 142 ml or 5 oz. of wine
- 43 ml or 1.5 oz. of liquor or spirit (straight or mixed)

☐ 1 Yes
☐ 2 No
☐ -8 I prefer not to answer
☐ -9 I don’t know

ALC04 Show if ALC03 1 Lifetime drinker
Not counting small sips, how old were you when you had your first alcoholic beverage?
Drinking does not include having a few sips of wine for religious purposes.

Minimum: 5, Maximum: 25

__________ years

☐ -8 I prefer not to answer
☐ -9 I don’t know

ALC05 Show if ALC03 1 Lifetime drinker
In the past 12 months, did you drink alcoholic beverages?
Drinking does not include having a few sips of wine for religious purposes.

☐ 1 Yes
☐ 2 No
☐ -8 I prefer not to answer
☐ -9 I don’t know

ALC06 Show if ALC05 1 Past 12 month drinker
During the past 30 days, how often did you drink alcoholic beverages?

☐ 1 Daily or almost daily
☐ 2 2 to 5 times a week
☐ 3 Once a week
☐ 4 2 to 3 times in the past 30 days
☐ 5 Once in the past 30 days

AEDtxt
The following questions are about energy drinks, such as Red Bull®, Rockstar® or another brand.

Energy drinks are beverages usually containing caffeine and other stimulant substances, such as guarana, taurine or L-carnitine. These drinks may be marketed as providing mental and physical stimulation.

Press the right arrow to continue.
In the past 30 days, how often did you drink any of the following?

1. An energy drink like Red Bull®, Monster® and Rockstar®, not sports drinks. *?* (Exclude coffee, tea, other naturally caffeinated beverages, and sports drinks marketed to replace water or electrolytes before or after exercise, e.g., Gatorade or Powerade.)
2. Alcohol and an energy drink drank separately on one occasion (Show if ALC05 1 Past 12 month drinker)
3. Alcohol and an energy drink hand-mixed together by you or someone else (Show if ALC05 1 Past 12 month drinker)
4. Store-bought pre-mixed alcoholic beverages with energy drink names (such as Rockstar®+Vodka) (Show if ALC05 1 Past 12 month drinker)
5. Sweetened beverages with high alcohol content (7% or higher) such as FourLoko, FCKDUP, Clubtails (Show if ALC05 1 Past 12 month drinker)

- 1 Daily or almost daily
- 2 2 to 5 times a week
- 3 Once a week
- 4 2 to 3 times in the past 30 days
- 5 Once in the past 30 days
- 6 Not in the past 30 days
- -8 I prefer not to answer
- -9 I don’t know

During the past 12 months, have you been a passenger in a motor vehicle *?* driven by someone who had 2 or more drinks of alcohol in the previous 2 hours?

*?* motor vehicle: (e.g., car, snowmobile, motor boat or all-terrain vehicle (ATV))

- 1 Yes
- 2 No
- -8 I prefer not to answer
- -9 I don’t know

During the past 12 months, have you driven a motor vehicle *?* after having 2 or more drinks in the previous 2 hours?

*?* motor vehicle: (e.g., car, snowmobile, motor boat or all-terrain vehicle (ATV))

- 1 Yes
- 2 No
- -8 I prefer not to answer
- -9 I don’t know
AHS  Show if ALC05 1 Past 12 month drinker
The following is a list of things that can sometimes happen to people either during or after they have been drinking alcohol.

Please indicate whether the statement describes something that has happened to you in the past 30 days because of your own drinking.

1. While drinking, I have said or done embarrassing things *
2. I have had a hangover (headache, sick stomach) the morning after I had been drinking *
3. I have felt very sick to my stomach or thrown up after drinking *
4. I have ended up drinking on nights when I had planned not to drink *
5. I have taken foolish risks when I have been drinking *
6. I have passed out from drinking *
7. I have found that I needed larger amounts of alcohol to feel any effect, or that I could no longer get drunk on the amount that used to get me drunk *
8. When drinking, I have done impulsive things that I regretted later *
9. I’ve not been able to remember large stretches of time while drinking heavily *
10. I have driven a motor vehicle when I knew I had too much to drink to drive safely *
11. I have missed work or classes at school because of drinking, a hangover, or illness caused by drinking *
12. My drinking has gotten me into sexual situations I later regretted *
13. I have found it difficult to limit how much I drink *
14. I have become very rude, obnoxious or insulting as a result of my drinking *
15. I have woken up in an unexpected place after heavy drinking *
16. I have felt badly about myself because of my drinking *
17. I have had less energy or felt tired because of my drinking *
18. The quality of my work or schoolwork has suffered because of my drinking *
19. I have spent too much time drinking *
20. I have neglected my obligations to family, work, or school because of drinking *
21. My drinking has created problems between myself and my boyfriend/girlfriend/spouse/partner, parents, or other near relatives *
22. I have put on weight because of drinking *
23. My physical appearance has been harmed by my drinking *
24. I have felt like I needed a drink after I’d gotten up (that is, before breakfast) *

Levels marked with * are randomized

☐ 3  Yes, within the past 30 days
☐ 2  Yes, but more than 30 days ago
☐ 1  No, never happened to me
☐ -8  I prefer not to answer
☐ -9  I don’t know
AHO

The following is a list of things that sometimes happen because of other student’s drinking.

Please indicate whether the statement describes something that has happened to you in the past 30 days because of another student’s drinking.

1. Interrupted your studies *
2. Affected your sleep *
3. Made you feel unsafe *
4. Messed up your living space or ruined your belongings *
5. Harassed or bothered you, called you names or insulted you *
6. Pushed, hit or assaulted you *
7. Sexually harassed or sexually assaulted you *
8. Caused an argument with you *
9. Had to be taken care of by you *
10. Upset or disappointed you *
11. Caused a problem in your friendships or relationships *

Levels marked with * are randomized

Section CAN

The next questions are about cannabis. In this survey when we use the term cannabis, this includes marijuana (e.g., weed, pot), hashish, hash oil or any other products made from the cannabis plant, but not synthetic cannabinoids.

When we ask about use, this includes using cannabis in its dry form or when mixed or processed into another product such as an edible, an extract, a concentrate, including hashish, a liquid, or other product.

When we ask about use of cannabis, this may include use for medical and/or non-medical purposes.

Press the right arrow to continue.
CAN01

Since the new cannabis law came into effect (October 17, 2018), have you seen/heard **education campaigns, public health or safety messages** about cannabis in any of the following places? 

*Select all that apply*

- 1. School (e.g., university campus, institutional e-mail)
- 2. Social media (e.g., Twitter, YouTube)
- 3. Non-social media websites
- 4. Events (e.g., sporting events, concerts, festivals or markets)
- 5. Kiosks or temporary sales locations (in shopping centres or on the street)
- 6. Inside/outside legal stores that sell cannabis
- 7. Public display of posters or billboards (e.g., in public transit, at bars/restaurants)
- 8. Health care setting (e.g., pharmacy, doctors office)
- 9. Print newspapers or magazines
- 10. TV/radio
- 11. Inside/outside illegal stores that sell cannabis
- 12. Other (please specify): __________________________________________
- 13. I have not noticed any education campaigns or public health messages (Exclusive)
- 8. I prefer not to answer
- 9. I don't know

CAN02

Based on what you know ... 

1. Can cannabis smoke be harmful?  
2. Can it be harmful to use cannabis when pregnant or breastfeeding?  
3. Can frequent use of cannabis increase the risk of mental health problems?  
4. Are teenagers at greater risk of harm from using cannabis than adults?  

- 1. Yes  
- 2. No  
- 8. I prefer not to answer  
- 9. I don't know

CAN03

Since the new cannabis law came into effect (October 17, 2018), has your knowledge of the harms related to cannabis increased?  

- 1. Yes  
- 2. No  
- 3. Somewhat  
- 8. I prefer not to answer  
- 9. I don't know

- 15. 5' 11" or 180 cm
- 16. 6' 0" or 183 cm
- 17. 6' 1" or 185 cm
- 18. 6' 2" or 188 cm
- 19. 6' 3" or 190 cm
- 20. 6' 4" or 193 cm
- 21. 6' 5" or 195 cm
- 22. 6' 6" or 198 cm
- 23. 6' 7" or 200 cm
- 24. More than 6' 7" or 200 cm

☐ -8. I prefer not to answer
☐ -9. I don't know
**DEMQ4**

What is your weight?

- 1. Less than 95 lb or 43 kg
- 2. 95 lb or 43 kg
- 3. 100 lb or 45 kg
- 4. 105 lb or 48 kg
- 5. 110 lb or 50 kg
- 6. 115 lb or 52 kg
- 7. 120 lb or 54 kg
- 8. 125 lb or 57 kg
- 9. 130 lb or 59 kg
- 10. 135 lb or 61 kg
- 11. 140 lb or 64 kg
- 12. 145 lb or 66 kg
- 13. 150 lb or 68 kg
- 14. 155 lb or 70 kg
- 15. 160 lb or 73 kg
- 16. 165 lb or 75 kg
- 17. 170 lb or 77 kg
- 18. 175 lb or 80 kg
- 19. 180 lb or 82 kg
- 20. 185 lb or 84 kg
- 21. 190 lb or 86 kg
- 22. 195 lb or 89 kg
- 23. 200 lb or 91 kg
- 24. 205 lb or 93 kg
- 25. 210 lb or 96 kg
- 26. 215 lb or 98 kg
- 27. 220 lb or 100 kg
- 28. 225 lb or 102 kg
- 29. 230 lb or 105 kg
- 30. 235 lb or 107 kg
- 31. 240 lb or 109 kg
- 32. 245 lb or 112 kg
- 33. 250 lb or 114 kg
- 34. 255 lb or 116 kg
- 35. 260 lb or 118 kg
- 36. 265 lb or 121 kg
- 37. 270 lb or 123 kg
- 38. 275 lb or 125 kg
- 39. 280 lb or 128 kg
- 40. 285 lb or 130 kg
- 41. 290 lb or 132 kg
- 42. 295 lb or 134 kg
